

Standing Up for the Unmeasurable in a Data-Driven Design Process

**Not everything that can
be counted counts and
not everything that
counts can be counted.**

— OFTEN ATTRIBUTED TO ALBERT EINSTEIN

**Data can make us
see more clearly.**

S.M.A.R.T

OKRs.

A/B-tests.

**Survival of the fittest
has turned into
survival of the
measurable.**

**The act of measuring
can cause unintended
consequences.**

**Performance
management in hospitals
has been linked to higher
mortality rates.**

“...over reliance o senior staff on the hospital’s PMS led to an organizational culture focused on doing the system’s ‘business’ (e.g. hitting performance targets), resulting in patient neglect and high mortality rates.”

“Make low mortality rates a performance target!” → can lead to lower acceptance of severe cases.

Avoiding unintended consequences with performance management systems can feel like trying to clutch water in your hands—the harder you grip, the faster it slips through your fingers.

**Hitting all the targets
but missing the
point.**

As we become more driven by data, can we lose touch with some of our core values?

**We aren't measuring
“good design” — we're
measuring clicks & taps.**

**We have a responsibility
to stand up for what
isn't measurable.**

**We have a
responsibility
to measure better.**

**Be the fiercest critic of
data-driven design processes,
yet insatiably curious about how
we can measure better.**

**A common
scenario.**

STATED HYPOTHESIS

“By featuring our offer at the top of the app we will increase sales, which will increase revenue”

Measure sales →
any increase in sales will
prove the hypothesis right.

A person wearing a white lab coat is looking at a laptop screen in a laboratory setting. The background is a solid blue color with a faint, semi-transparent image of the person and the laptop. The text is overlaid on the image.

**A hypothesis that can only
be proven right is not a
hypothesis, it's a trap.**

STATED HYPOTHESIS

By featuring our offer at the top of the app we will increase sales, which will increase revenue

ACTUAL HYPOTHESIS

By featuring our offer at the top of the app we will increase sales, which will increase revenue **unless retention decreases**

A design that introduces friction always risks bringing down vital key metrics that can hurt the bottom-line.

**Retention is the best proxy
for quality, but it can be
difficult to detect meaningful
changes.**

We often lean on other metrics—such as engagement—that are easier and cheaper to quantify.

Any performance metric will eventually be gambled, manipulated, and diluted of its original value.

**A common
scenario.**

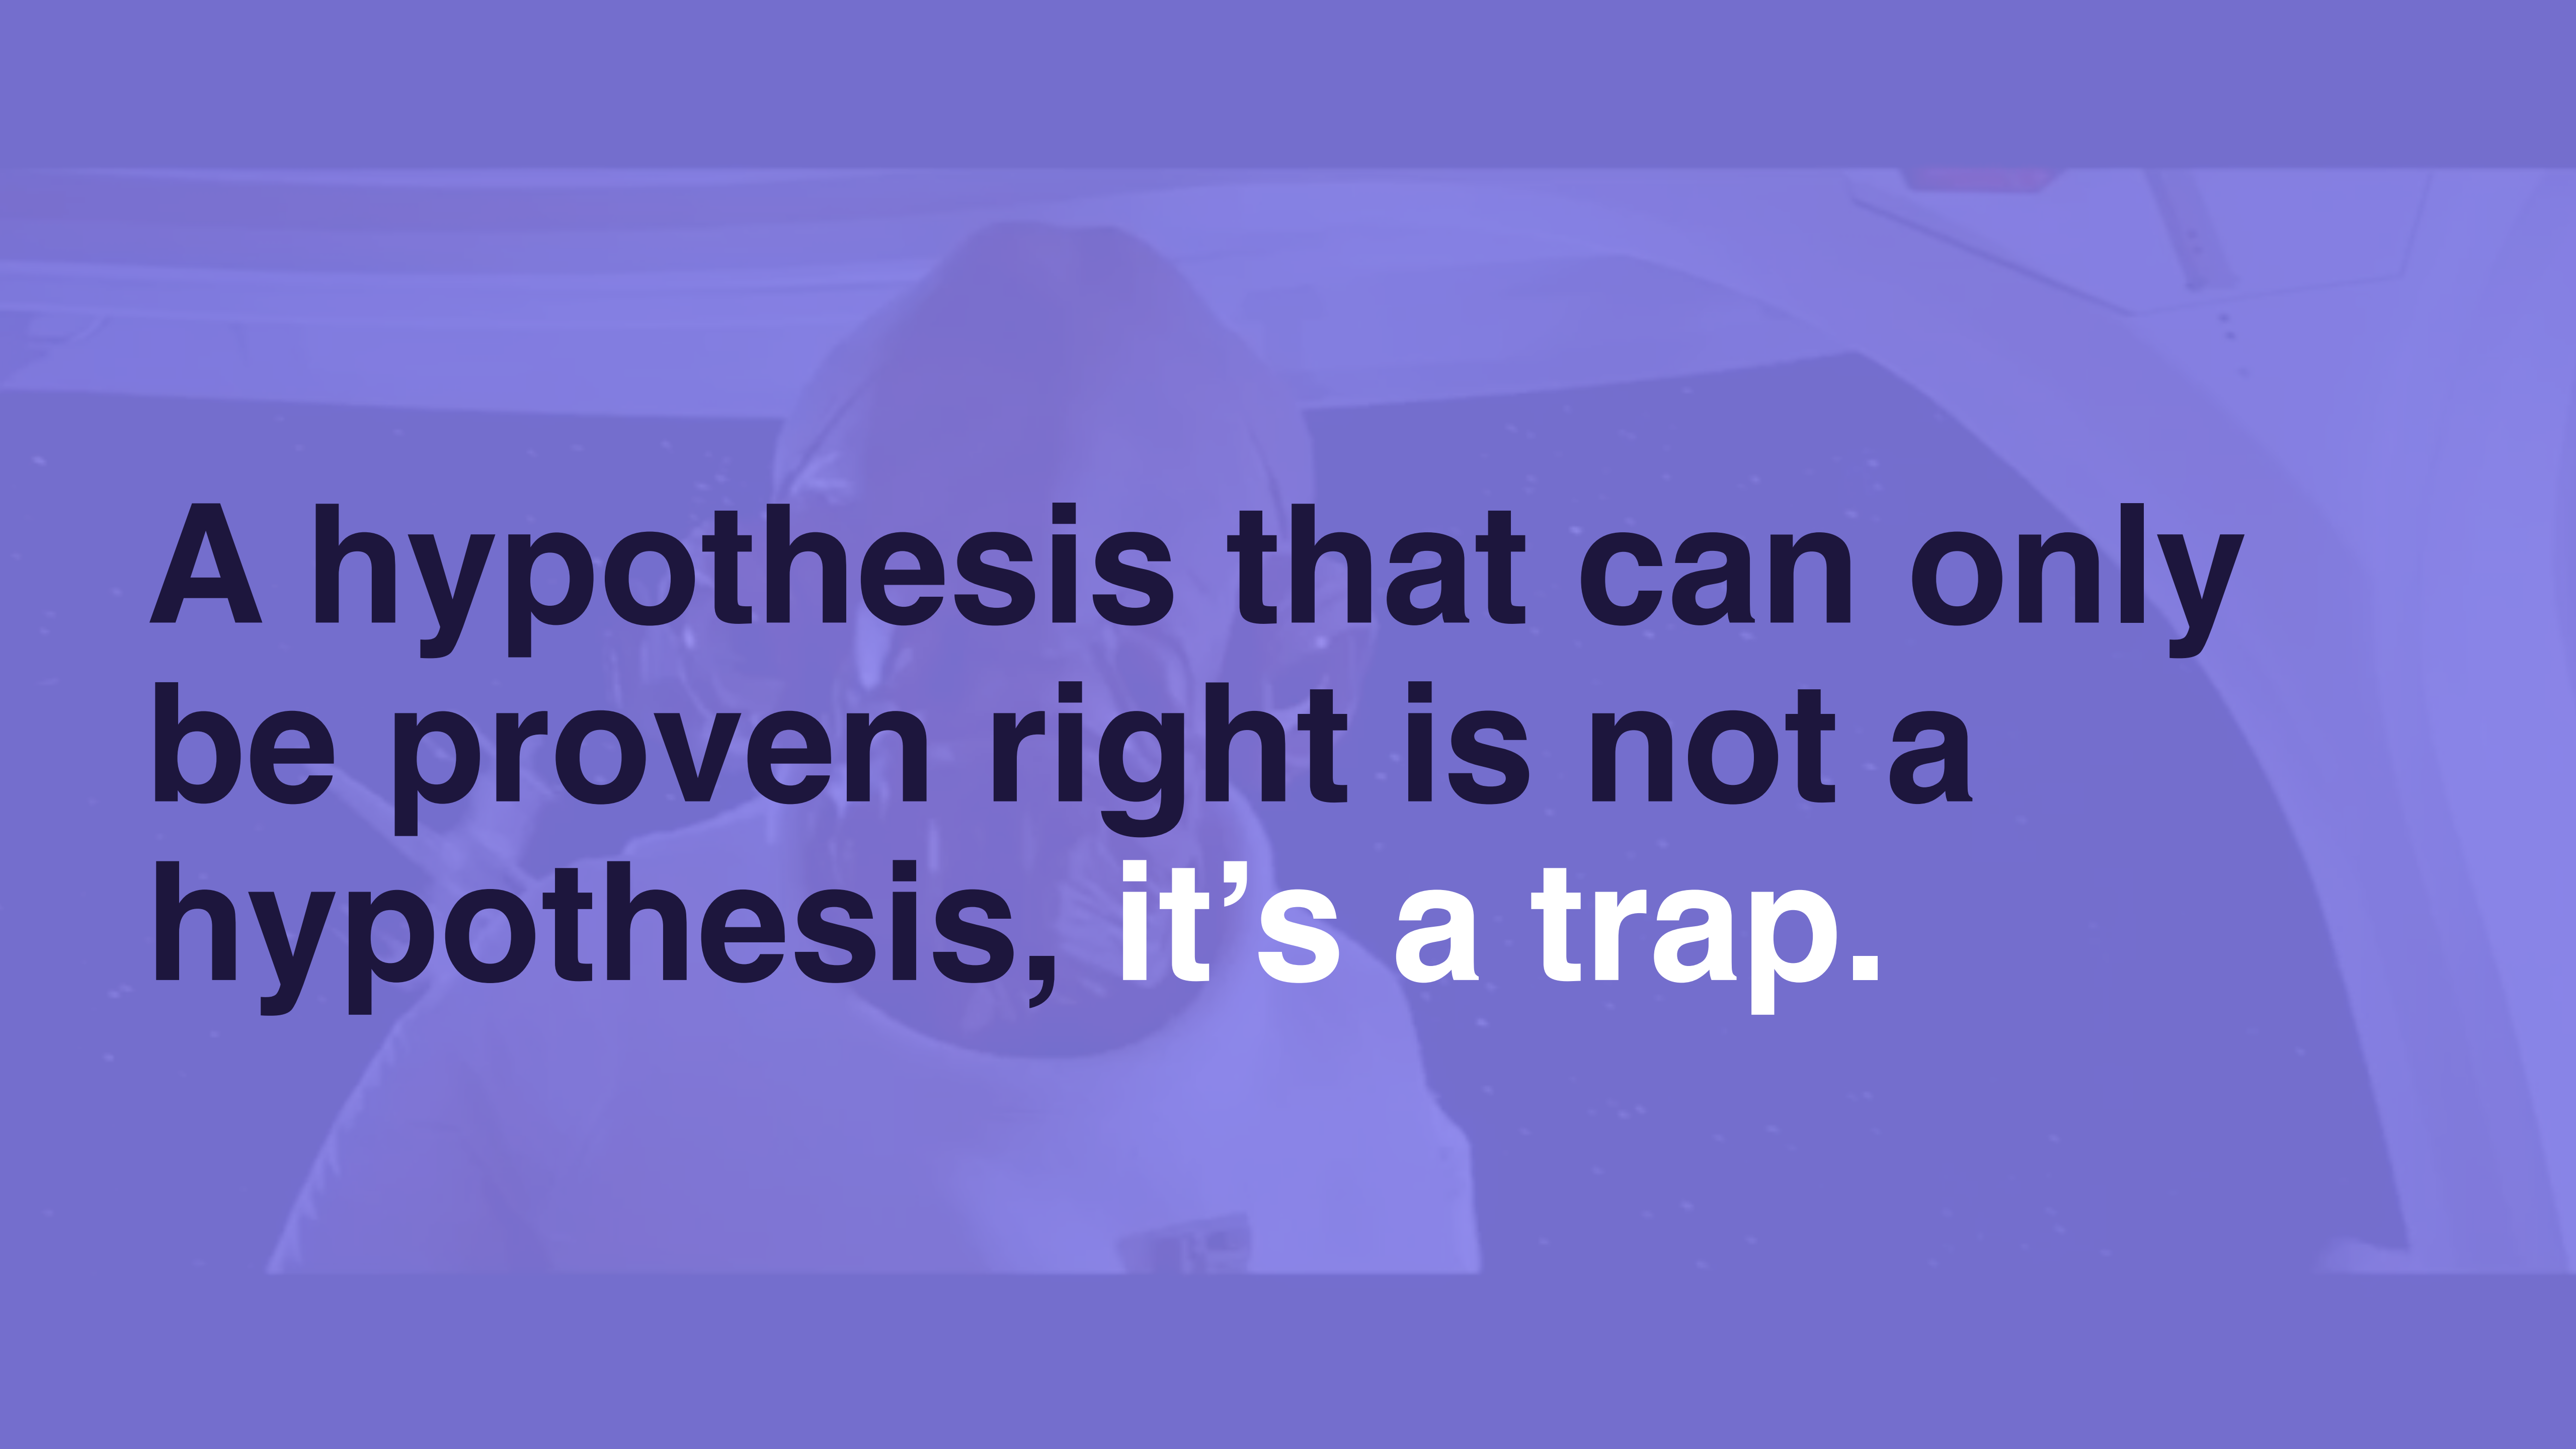

A COMPANY GOAL

**Increase engagement
(because it correlates
with retention)**

**Autoplay recommended
clips →
brings up engagement.**

STATED HYPOTHESIS

“By auto-playing new recommended clips when a clip has ended, we will bring up engagement”

A person wearing a white lab coat is looking at a laptop screen in a laboratory setting. The background is a blue-tinted image of the person and the lab equipment.

**A hypothesis that can only
be proven right is not a
hypothesis, it's a trap.**

→ engagement will correlate less strongly with retention, and is diluted of its value as a key metric.

→ you might be bringing retention down (**because annoying**)

**Hitting all the targets
but missing the
point.**

**We have a
responsibility to ask
“Why?” & “At what cost?”**

**Standing up for your
core values
can be profitable.**

Saying no
can be difficult.

Measure differently.

Measure

less.

**Measure
better.**

**Don't forget
what brought you
into design.**

**Not everything that can
be counted counts and
not everything that
counts can be counted.**
